CLAIMS

1. (Unchanged) An apparatus for rotating a display orientation of captured
image data representative of an object, the apparatus comprising:
an image sensor, for generating said captured image data;
an orientation sensor coupled to said image sensor, for generating a signal
corresponding to the position of the image sensor relative to said
object;
a memory, having an auto-rotate unit comprising program instructions for
selectively transforming said captured image data into rotated im-
age data in response to said position signal, said memory coupled to
said image sensor and to said orientation sensor; and
an image processing unit coupled to said memory for executing program
instructions stored in said memory; and
an image capture unit generates an additional row and column of pixels
for said captured image data from said image sensor
[wherein (a) said image processing unit processes an i-by-j array of said captured
image data and said image sensor generates an i+1-by-j+1 array of said im-
age data, or (b) an image capture unit generates an additional row and col-
umn of pixels for said captured image data from said image sensor].
2. (As Filed) The apparatus of claim 1, wherein the memory further com-
prises:
an image processing unit comprising program instructions for transform-
ing one from a group consisting of captured image data and portrait
image data, into processed image data.

3. (As Filed) The apparatus of claim 1, wherein: the signal is a portrait_left

signal if the image sensor is rotated clockwise from a landscape orientation relative

to the object, and the signal is a portrait_right signal if the image sensor is rotated 3 counter-clockwise from the landscape orientation relative to the object; and the auto-rotate unit comprises program instructions for transforming the captured image data into portrait_left image data in response to the portrait_left signal and into portrait_right, image data in response to the portrait_right signal. 4. (As Filed) The apparatus of claim 1, wherein: the signal is a landscape signal if the image sensor is positioned in a level orientation relative to the object; and 3 the auto-rotate unit comprises program instructions for transforming the 4 captured image data into/landscape image data in response to the 5 landscape signal. 6 5. (As Filed) The apparatus of claim 3, wherein: 7 the image sensor has a top, a bottom, a right side and a left side; 2 the auto-rotate unit program instructions transform the captured image 3 data into the portrait_left image data by transferring a prior portrait_left line of image data which starts further toward the bottom 5 of the image sensor and ends further toward the top of the image

the auto-rotate unit program instructions transform the captured image data into the portrait_right image data by transferring a prior portrait_right line of image data which starts further toward the top of the image sensor and ends further toward the bottom of the image sensor, then transferring a subsequent portrait_right line of image data, located closer to the left side of the image sensor than the prior portrait_right line of image data, and also starting further toward the top of the image sensor and ending further toward the bottom of the image sensor.

6. (As Filed) The apparatus of claim 4, wherein:

the image sensor has a top, a bottom, a right side and a left side; and the auto-rotate unit program instructions transform the captured image data into the landscape imagé data by transferring a prior landscape line of image data which starts further toward the left side of the image sensor and ends further toward the right side of the image sensor, then transferring a subsequent landscape line of image data, located closer to the bottom of the image sensor than the prior landscape line of image data, and also starting further toward the left side of the image sensor and ending further toward the right side of the image sensor.

sensor if the imaging subsystem is rotated approximately 45° counter-clockwise from the level orientation.

8. (As Filed) The apparatus of claim 5, wherein:

the prior portrait_left line of image data and the prior portrait_right line of image data comprise a "green, red, green, red" pixel pattern; and the subsequent portrait_left line of image data and the subsequent portrait_right line of image data comprise a "blue, green, blue, green" pixel pattern.

9. (As Filed) An apparatus for rotating a display orientation of multicolor captured image data having an i-by-j pixel matrix with a pattern representative of an object, comprising:

an image sensor, for generating the multicolor captured image data; an input device, for generating a portrait_left signal in response to a first user selection, a portrait_right signal in response to a second user selection, and a landscape signal in response to a third user selection;

a memory, having:

an auto-rotate unit comprising program instructions for selectively transforming the multicolor captured image data
into portrait_left image data in response to the portraitleft signal, portrait_right image data in response to the
portrait_right signal, and landscape image data in response to the landscape signal; and
an image processing unit comprising program instructions for

transforming the portrait_left image-data, the por-

19	processed image data; and
20	a processing unit, coupled to the image sensor, to the input device and to
21	the memory, for executing program instructions stored in the mem-
22	ory;
23	wherein said image processing unit changes the number of pixel rows and
24	pixel columns of the multicolor captured image data such that, from
25	a defined referenced viewpoint, the portrait left image data, the por-
/ fell	\mathfrak{A} trait right image data, and the landscape image data, each includes
\$\)\	the an (i-1)-by-(j-1) pixel matrix having said pattern.
1	10. (As Filed) The apparatus of claim 9, wherein the image processing unit
2	has a first line length for processing the portrait_left image data and the por-
3	trait_right image data and a second line length for processing the landscape image
4	data.
. 1	11. (Unchanged) A method for rotating a display orientation of image data
2	representative of an object, comprising the steps of:
3	generating image data with an image sensor;
4	identifying an orientation of the image sensor relative to the object at a
5	time substantially simultaneous with the generating step, where
. 6	said identifying is performed by an orientation sensor; and
7	selectively transferring data to an image processing unit in response to the
8	identifying step;
9	[wherein said image processing unit rotates said display orientation of said image
10	data and (a) said image processing unit processes an i-by-j array of said

of said image data, or (b) an image capture unit generates an additional xow and column of pixels for said captured image data from said image sensor] wherein said image processing unit rotates said orientation of said/image data by generating an additional row and column of pixels for said captured image data from said image sensor.

12. (Cancelled)

13. (As Filed) The method of claim 11, further comprising the step of correcting defects within the image data caused by defects within the image sensor.

14. (As Filed) The method of claim 11, wherein the image sensor comprises a top, a right side and a left side, wherein the image comprises a "top portion," and wherein the step of identifying an orientation further comprises the steps of: identifying a portrait_left orientation, if the left side of the image sensor corresponds to the "top portion" of the object; identifying a portrait_right orientation, if the right side of the image sensor corresponds to the "top portion" of the object; and identifying a landscape orientation, if the top of the image sensor corresponds to the "top portion" of the object.

15. (As Filed) The method of claim 11, wherein the step of identifying an orientation further comprises the steps of:

identifying a portrait_left orientation, in response to a user selection of the portráit_left orientation on an input device; identifying a portrait_right orientation, in response to a user selection of

the portrait_right orientation on the input device; and

configuring the image processing unit to accept an image data line length

	3	corresponding to the portrait_left orientation; and
	4	performing image processing on a line of transferred image data.
17/	1	19. (As Filed) The method of claim 11, wherein the orientation is a por-
C	2	trait_right orientation, wherein the image data is comprised of an array of pixel col-
	3	ors ordered in rows and columns, and wherein the step of selectively transferring
	4	comprises the steps of:
	5	initializing a column variable to a first column of pixel colors required by
R	6	the image processing unit;
Rys	7	initializing a row variable to a row containing a first pixel color required
O	8	by the image processing unit;
	9	transferring pixel color at an array location defined by the row variable
	10	and the column variable, to the image processing unit;
	11	incrementing the row variable to a row containing a next pixel color re-
	12	quired by the image processing unit;
	13	returning to the transferring step, if a row containing a last pixel color has
	14	not been transferred;
	15	decrementing the column variable to a next column of pixel colors re-
	16	quired by the image processing unit; and

20. (As Filed) The method of claim 11, wherein the orientation is a landscape orientation, wherein the image data is comprised of an array of pixel colors ordered in rows/and columns, and wherein the step of selectively transferring further comprises the steps of:

colors has not been transferred.

returning to the initializing a row variable step, if a last column of pixel

7	initializing a column variable to a column containing a first pixel color re-
8	quired by the image processing unit;
9	transferring pixel color at an array location defined by the row variable
10	and the column variable, to the image processing unit;
11	incrementing the column variable to a column containing a next pixel color
12	required by the image processing unit;
13	returning to the transferring step, if a column containing a last color pixel
14	has not been transferred;
15	incrementing the row variable to a next row of pixel colors required by the
16	image processing unit; and
17	returning to the initializing a column variable step, if a last row of pixel
18	colors has not been transferred.
1	21. (Amended) An apparatus for rotating a display orientation of multicolor
2	image data having an i-by-j pixel matrix with a pattern representative of an object,
3	comprising:
4	means for generating multicolor image data with an image sensor, the im-
5	age data having a Bayer pattern;
6	orientation sensor means for identifying an orientation of said image sen-
7	sor relative to said object at a time substantially simultaneous with
8	said generating said multicolor image data; and
9	means for selectively transferring said multicolor image data to an image
10	processing unit in response to said means for identifying;
11	wherein said image processing unit rotates said display orientation of said
12	multicolor image data for providing rotated multicolor image data,

and changes the number of pixel rows and pixel columns of said multicolor image data such that, from a defined referenced viewpoint, said rotated multicolor image data includes having an (i-1)-by-(j-1) pixel matrix said pattern.

22. (As Filed) The apparatus of claim 21, further comprising means for generating an additional row and column of image data.

23. (As Filed) The apparatus of claim 21, further comprising means for correcting defects within the image data caused by defects within the image sensor.

24. (As Filed) The apparatus of claim 21, wherein the image sensor comprises a top, a right side and a left side, wherein the image comprises a "top portion," and wherein the means for identifying an orientation further comprises:

means for identifying a portrait_left orientation, if the left side of the image sensor corresponds to the "top portion" of the object;

means for identifying a portrait_right orientation, if the right side of the image sensor corresponds to the "top portion" of the object; and means for identifying a landscape orientation, if the top of the image sensor corresponds to the "top portion" of the object.

25. (As Filed) The apparatus of claim 21, wherein the orientation is a portrait_left orientation, wherein the image data is comprised of an array of pixel colors ordered in rows and columns, and wherein the means for selectively transferring comprises:

means for initializing a column variable to a first column of pixel colors required by the image processing unit;

- 29. (As Filed) The computer useable medium of claim 28, further comprising program code for generating an additional row and column of image data.
- 30. (As Filed) The computer useable medium of claim 28, further comprising program code for correcting defects within the image data caused by defects within the image sensor.
- 31. (As Filed) The computer useable medium of claim 28, wherein the image sensor comprises a top, a right side and a left side, wherein the image comprises a "top portion," and wherein the program code for performing the step of identifying an orientation further comprises program code for:

App. No. 10/040,249

- 14 -

identifying a portrait_left orientation, if the left side of the image sepsor

6	corresponds to the "top portion" of the object;
7	identifying a portrait_right orientation, if the right side of the image sensor
8	corresponds to the "top portion" of the object; and
9	identifying a landscape orientation, if the top of the image sensor corre-
10	sponds to the "top portion" of the object.
1	32. (As Filed) The computer useable medium of claim 28, wherein the orien-
2	tation is a portrait_left orientation, wherein the image data/is comprised of an array
3	of pixel colors ordered in rows and columns, and wherein the program code for per-
4	forming the step of selectively transferring comprises program code for:
5	initializing a column variable to a first column of pixel colors required by
6	the image processing unit;
7	initializing a row variable to a row containing a first pixel color required
8	by the image processing unit;
9	transferring pixel color at an array location, defined by the row variable
10	and the column variable, to the image processing unit;
11	decrementing the row variable to a row containing a next pixel color re-
12	quired by the image processing unit;
13	returning to the transferring step, if a row containing a last pixel color has
14	not been transferred;
15	incrementing the column variable to a next column of pixel colors required
16	by the image processing unit; and
17	returning to the initializing a row variable step, if a last column of pixel
18	colors/has not been transferred.

object, comprising:

an image sensor, for generating said multicolor captured image data, the

image data having a Bayer pattern;

an orientation sensor coupled to said image sensor, for generating a signal

corresponding to the position of said image sensor relative to said

object; and

a hardware device, having an auto-rotate unit comprising circuits for selectively transforming said multicolor captured image data into rotated

multicolor image data in response to said position signal, said

hardware device coupled to said image sensor and to said orientation sensor;

wherein, from a defined referenced viewpoint, said rotated multicolog im-14 age data includes an (i-1)-by-(j-1) pixel matrix having said pattern. 25 36. (Unchanged) An apparatus for rotating a display orientation of captured 1 image data representative of an object, the apparatus comprising: an image sensor, for generating said captured image data: an input device, for generating an orientation signal in response to a user selection: 5 a memory, having an auto-rotate unit for selectively transforming said captured image data into rotated image data in response to said orientation signal from said input device; and an image processing unit coupled to said memory for processing the image data by generating at least one additional row and column of pixels for said captured image data from said image sensor. 37. (Twice Amended) A digital image capture device, comprising: 1 an image sensor, for capturing image data; 2 an orientation sensor, for generating an orientation signal indicating 3 whether the image sensor is in a portrait or landscape position; and 5 an auto-rotate unit coupled to the image sensor and the orientation sensor, for automatically rotating a subset of the image data in response to 6 the orientation signal. 7

a. Car	4	the image data to form an i+m-by-j+n array of image data.
		./
	1	46. (Amended Three Times) A digital image capture device, comprising:
1	2	image sensor means for generating image data;
U V	3	means for generating an orientation signal indicating either a portrait ori-
1/1/1	4	entation or a landscape orientation of the image sensor; and
C	5	means for automatically rotating a subset of the image data in response to
	6	the orientation signal.
	1	47. (Unchanged) A digital image capture device, comprising:
	2	an image sensor, for generating said captured image data including a plu-
	3	rality of rows and columns of pixels;
	4	an orientation sensor coupled to said image sensor, for generating a posi-
	5	tion signal indicating whether the image sensor is in a portrait or
	6	landscape position;
	7	a memory, having an auto-rotate unit comprising program instructions for
	8	selectively transforming said captured image data into rotated im-
	9	age data in response to said position signal by processing at least
	10	one row of pixels and at least one column of pixels less than the plu-
	11	rality of rows and columns of pixels in the captured image data,
	12	said memory coupled to said image sensor and to said orientation
	13	sensor: and

		1

14	an image processing unit coupled to said memory for executing the stored
15	program instructions to rotate said capture image data.
0, (Q. 1	48. (Unchanged) A method for rotating a display orientation of image data,
\mathcal{M}_{0}^{2}	comprising:
COVI 13	generating image data with an image sensor including a plurality of rows
W^{r}	and columns of pixels;
5	determining with an orientation sensor a portrait orientation or a land-
6	scape orientation for the image data substantially simultaneously
7	with generating the image data; and
8.	processing the image data with an image processing unit in response to the
9	orientation signal to rotate the image data, by rotating less than all
10	of the plurality of rows and columns of pixels of the image data.
